

SecretCodeTranslator Documentation

Overview

SecretCodeTranslator is a Python program that allows users to encode messages into secret code language and decode them back to their original form. It implements simple rules for encoding and decoding messages, adding a layer of fun and mystery to communication.

Usage

1. Run the program.
2. Choose to encode or decode a message.
3. Input your message.
4. View the result.

Rules

- **Encoding:** If a word has three or more characters, move the first letter to the end and add three random characters at the start and end. Otherwise, reverse the string.
- **Decoding:** If a word has fewer than three characters, reverse it. Otherwise, remove three random characters from the start and end, then move the last letter to the beginning.

Installation

5. Clone the repository.
6. Navigate to the project directory.
7. Run the Python script.

Requirements

- Python 3.x
